Knights

The latest version of Python you should use in this course is Python 3.12.

Write a program to solve logic puzzles.

When to Do It

By Thursday, January 1, 2026 at 12:59 AM GMT+1 (https://time.cs50.io/20251231T235900Z)

How to Get Help

- 1. Ask questions via <a>Ed (https://cs50.edx.org/ed)!
- 2. Ask questions via any of CS50's communities!

Background

In 1978, logician Raymond Smullyan published "What is the name of this book?", a book of logical puzzles. Among the puzzles in the book were a class of puzzles that Smullyan called "Knights and Knaves" puzzles.

In a Knights and Knaves puzzle, the following information is given: Each character is either a knight or a knave. A knight will always tell the truth: if knight states a sentence, then that sentence is true. Conversely, a knave will always lie; if a knave states a sentence, then that sentence is false.

The objective of the puzzle is, given a set of sentences spoken by each of the characters, determine, for each character, whether that character is a knight or a knave.

For example, consider a simple puzzle with just a single character named A. A says "I am both a knight and a knave."

Logically, we might reason that if A were a knight, then that sentence would have to be true. But we know that the sentence cannot possibly be true, because A cannot be both a knight and a knave – we know that each character is either a knight or a knave, but not both. So, we could conclude, A must be a knave.

That puzzle was on the simpler side. With more characters and more sentences, the puzzles can get trickier! Your task in this problem is to determine how to represent these puzzles using propositional logic, such that an Al running a model-checking algorithm could solve these puzzles for us.

Getting Started

 Download the distribution code from https://cdn.cs50.net/ai/2023/x/projects/1/knights.zip and unzip it.

Understanding

Take a look at logic.py, which you may recall from Lecture 1. No need to understand everything in this file, but notice that this file defines several classes for different types of logical connectives. These classes can be composed within each other, so an expression like And (Not (A), Or (B, C)) represents the logical sentence stating that symbol A is not true, and that symbol B or symbol C is true (where "or" here refers to inclusive, not exclusive, or).

Recall that logic.py also contains a function model_check. model_check takes a knowledge base and a query. The knowledge base is a single logical sentence: if multiple logical sentences are known, they can be joined together in an And expression. model_check recursively considers all possible models, and returns True if the knowledge base entails the query, and returns False otherwise.

Now, take a look at puzzle.py. At the top, we've defined six propositional symbols. AKnight, for example, represents the sentence that "A is a knight," while AKnave represents the sentence that "A is a knave." We've similarly defined propositional symbols for characters B and C as well.

What follows are four different knowledge bases, knowledge0, knowledge1, knowledge2, and knowledge3, which will contain the knowledge needed to deduce the solutions to the upcoming Puzzles 0, 1, 2, and 3, respectively. Notice that, for now, each of these knowledge bases is empty. That's where you come in!

The main function of this puzzle.py loops over all puzzles, and uses model checking to compute, given the knowledge for that puzzle, whether each character is a knight or a knave, printing out any conclusions that the model checking algorithm is able to make.

Specification

Add knowledge to knowledge bases knowledge0, knowledge1, knowledge2, and knowledge3 to solve the following puzzles.

- Puzzle 0 is the puzzle from the Background. It contains a single character, A.
 - A says "I am both a knight and a knave."
- Puzzle 1 has two characters: A and B.
 - A says "We are both knaves."
 - B says nothing.
- Puzzle 2 has two characters: A and B.
 - A says "We are the same kind."
 - B says "We are of different kinds."
- Puzzle 3 has three characters: A, B, and C.
 - A says either "I am a knight." or "I am a knave.", but you don't know which.
 - B says "A said 'I am a knave."
 - B then says "C is a knave."
 - C says "A is a knight."

In each of the above puzzles, each character is either a knight or a knave. Every sentence spoken by a knight is true, and every sentence spoken by a knave is false.

Once you've completed the knowledge base for a problem, you should be able to run python puzzle.py to see the solution to the puzzle.

Hints

• For each knowledge base, you'll likely want to encode two different types of information: (1) information about the structure of the problem itself (i.e., information given in the definition of a Knight and Knave puzzle), and (2) information about what the characters actually said.

- Consider what it means if a sentence is spoken by a character. Under what conditions is that sentence true? Under what conditions is that sentence false? How can you express that as a logical sentence?
- There are multiple possible knowledge bases for each puzzle that will compute the correct result. You should attempt to choose a knowledge base that offers the most direct translation of the information in the puzzle, rather than performing logical reasoning on your own. You should also consider what the most concise representation of the information in the puzzle would be.
 - For instance, for <u>Puzzle 0</u>, setting <u>knowledge0</u> = AKnave would result in correct output, since through our own reasoning we know A must be a knave. But doing so would be against the spirit of this problem: the goal is to have your AI do the reasoning for you.
- You should not need to (nor should you) modify logic.py at all to complete this problem.

Testing

Unlike most other problems in the course, you must get Knights 100% correct in order to pass. This is an exception to the course's ordinary expectation that a score of 70% is considered a passing grade. Do be aware!

If you'd like, you can execute the below (after setting-up check50.check50
(https://cs50.readthedocs.io/projects/check50/en/latest/index.html) on your system) to evaluate the correctness of your code. This isn't obligatory; you can simply submit following the steps at the end of this specification, and these same tests will run on our server. Either way, be sure to compile and test it yourself as well!

check50 ai50/projects/2024/x/knights

Execute the below to evaluate the style of your code using style50.

style50 puzzle.py

Remember that **you may not import any modules** (other than those in the Python standard library) **other than those explicitly authorized herein**. Doing so will not only prevent check50 from running, but will also prevent submit50 from scoring your assignment, since it uses check50. If that happens, you've likely imported something disallowed or otherwise modified the distribution code in an unauthorized manner, per the specification. There are certainly tools out there that trivialize some of these projects, but that's not the

goal here; you're learning things at a lower level. If we don't say here that you can use them, you can't use them.

How to Submit

Beginning Monday, January 1, 2024 at 1:00 AM GMT+1

(https://time.cs50.io/20240101T000000Z), the course has transitioned to a new submission platform. If you had not completed CS50 AI prior to that time, you must join the new course pursuant to Step 1, below, and also must resubmit all of your past projects using the new submission slugs to import their scores. We apologize for the inconvenience, but hope you feel that access to check50, which is new for 2024, is a worthwhile trade-off for it, here!

- 1. Visit this link (https://submit.cs50.io/invites/d03c31aef1984c29b5e7b268c3a87b7b), log in with your GitHub account, and click Authorize cs50. Then, check the box indicating that you'd like to grant course staff access to your submissions, and click Join course.
- 2. <u>Install Git (https://git-scm.com/downloads)</u> and, optionally, <u>install submit50</u> (https://cs50.readthedocs.io/submit50/).
- 3. If you've installed submit50, execute

```
submit50 ai50/projects/2024/x/knights
```

Otherwise, using Git, push your work to https://github.com/me50/USERNAME.git, where USERNAME is your GitHub username, on a branch called ai50/projects/2024/x/knights.

If you submit your code directly using Git, rather than submit50, **do not** include files or folders other than those you are actually instructed to modify in the specification above. (That is to say, don't upload your entire directory!)

Work should be graded within five minutes. You can then go to https://cs50.me/cs50ai to view your current progress!
